Unit 13: Fundamentals of Thermodynamics and Heat Engines

Unit code: D/615/1487
Unit level: 4
Credit value: 15

Introduction

Thermodynamics is one of the most common applications of science in our lives, and it is so much a part of our daily life that it is often taken for granted. For example, when driving your car you know that the fuel you put into the tank is converted into energy to propel the vehicle, and the heat produced by burning gas when cooking will produce steam which can lift the lid of the pan. These are examples of thermodynamics, which is the study of the dynamics and behaviour of energy and its manifestations.

This unit introduces students to the principles and concepts of thermodynamics and its application in modern engineering.

On successful completion of this unit students will be able to investigate fundamental thermodynamic systems and their properties, apply the steady flow energy equation to plant equipment, examine the principles of heat transfer to industrial applications, and determine the performance of internal combustion engines.

Learning Outcomes

By the end of this unit students will be able to:
1. Investigate fundamental thermodynamic systems and their properties.
2. Apply the Steady Flow Energy Equation to plant equipment.
3. Examine the principles of heat transfer to industrial applications.
4. Determine the performance of internal combustion engines.
Essential Content

LO1  Investigate fundamental thermodynamic systems and their properties

*Fundamental systems:*
- Forms of energy and basic definitions
- Definitions of systems (open and closed) and surroundings
- First law of thermodynamics
- The gas laws: Charles’ Law, Boyle’s Law, general gas law and the Characteristic Gas Equation
- The importance and applications of pressure/volume diagrams and the concept of work done
- Polytrophic processes: constant pressure, constant volume, adiabatic and isothermal systems

LO2  Apply the Steady Flow Energy Equation to plant equipment

*Energy equations:*
- Conventions used when describing the behaviour of heat and work
- The Non-Flow Energy Equation as it applies to closed systems
- Assumptions, applications and examples of practical systems
- Steady Flow Energy Equation as applied to open systems
- Assumptions made about the conditions around, energy transfer and the calculations for specific plant equipment e.g. boilers, super-heaters, turbines, pumps and condensers

LO3  Examine the principles of heat transfer to industrial applications

*Principles of heat transfer:*
- Modes of heat transmission, including conduction, convection & radiation
- Heat transfer through composite walls and use of $U$ and $k$ values
- Application of formulae to different types of heat exchangers, including recuperator and evaporative
- Regenerators
- Heat losses in thick and thin walled pipes, optimum lagging thickness
LO4  **Determine the performance of internal combustion engines**

*Performance:*

Application of the second law of thermodynamics to heat engines

Comparison of theoretical and practical heat engine cycles, including Otto, Diesel and Carnot

Explanations of practical applications of heat engine cycles, such as compression ignition (CI) and spark ignition engines, including their relative mechanical and thermodynamic efficiencies

Describe possible efficiency improvements to heat engines
