

Unit 38: Further Thermodynamics

Unit code	D/615/1506
Unit level	5
Credit value	15

Introduction

From the refrigerators that we use in our homes to the colossal power stations that generate the electricity we use and provide power to industry, the significance that thermodynamics plays in the 21st century cannot be underestimated.

The aim of this unit is to build on the techniques explored in *Unit 13: Fundamentals of Thermodynamics and Heat Engines*, to develop further students' skills in applied thermodynamics by investigating the relationships between theory and practice.

Among the topics included in this unit are: heat pumps and refrigeration, performance of air compressors, steam power plant and gas turbines.

On successful completion of this unit students will be able to determine the performance and operation of heat pumps and refrigeration systems, review the applications and efficiency of industrial compressors, use charts and/or tables to determine steam plant parameters and characteristics, describe the operation of gas turbines and assess their efficiency.

Learning Outcomes

By the end of this unit students will be able to:

1. Evaluate the performance and operation of heat pumps and refrigeration systems.
2. Review the applications and efficiency of industrial compressors.
3. Determine steam plant parameters and characteristics using charts and/or tables.
4. Examine the operation of gas turbines and assess their efficiency.

Essential Content

LO1 Evaluate the performance and operation of heat pumps and refrigeration systems

Heat pumps and refrigeration:

Reversed heat engines: reversed Carnot and Rankine cycles

Second law of thermodynamics

Refrigeration tables and charts (p-h diagrams)

Coefficient of performance of heat pumps and refrigerators

Refrigerant fluids: properties and environmental effects

Economics of heat pumps

LO2 Review the applications and efficiency of industrial compressors

Performance of air compressors:

Theoretical and realistic cycles

Isothermal and adiabatic work

Volumetric efficiency

Intercoolers, dryers and air receivers

Hazards and faults: safety consideration and associated legislation

LO3 Determine steam plant parameters and characteristics, using charts and/or tables

Steam power plant:

Use of tables and charts to analyse steam cycles

Circuit diagrams showing boiler, super heater, turbine, condenser and feed pump

Theoretical and actual operation: Carnot and Rankine cycle

Efficiencies and improvements

LO4 Examine the operation of gas turbines and assess their efficiency

Gas turbines:

Single and double shaft gas turbine operation

Property diagrams: Brayton (Joule) cycle

Intercooling, reheat and regeneration

Combined heat and power plants

Self-starting and burner ignition continuation

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
L01 Evaluate the performance and operation of heat pumps and refrigeration systems		D1 Conduct a cost-benefit analysis on the installation of a ground source heat pump on a smallholding to make valid recommendations for improvements
<p>P1 Using didactic sketches, evaluate the operating principles of both heat pumps and refrigeration systems</p> <p>P2 Use refrigeration tables and pressure/enthalpy charts to determine COP, heating effect and refrigeration effect of reversed heat engines</p>	<p>M1 Assess the limiting factors that impact on the economics of heat pumps</p> <p>M2 Illustrate the contradiction between refrigeration cycles and the second law of thermodynamics</p>	
L02 Review the applications and efficiency of industrial compressors		D2 Critically evaluate volumetric efficiency formula for a reciprocating compressor
<p>P3 Assess the different types of industrial compressor and identify justifiable applications for each</p> <p>P4 Discuss compressor faults and potential hazards</p> <p>P5 Determine the volumetric efficiency of a reciprocating compressor</p>	M3 Evaluate isothermal efficiency by calculating the isothermal and polytropic work of a reciprocating compressor	

Pass	Merit	Distinction
LO3 Determine steam plant parameters and characteristics using charts and/or tables		D3 Critically evaluate the pragmatic modifications made to the basic Rankine cycle to improve the overall efficiency of steam generation power plants
P6 Discuss the need for superheated steam in a power generating plant P7 Apply the use of charts and/or tables to establish overall steam plant efficiencies in power systems	M4 Justify why the Rankine cycle is preferred over the Carnot cycle in steam production plants around the world	
LO4 Examine the operation of gas turbines and assess their efficiency		D4 Critically analyse the practical solutions manufacturers offer to overcome problematic areas in gas turbines, such as burner ignition continuation and self-starting capabilities
P8 Investigate the principles of operation of a gas turbine plant P9 Assess the efficiency of a gas turbine system	M5 Compare and evaluate the actual plant and theoretical efficiencies in a single shaft gas turbine system, accounting for any discrepancies found
