Unit 52: Further Electrical, Electronic and Digital Principles

Unit code L/615/1520
Unit level 5
Credit value 15

Introduction
Almost every aspect of our lives relies on electrical powered, electronically controlled machines and devices, many of them digital in format. To properly understand how to make the most efficient use of these devices in a safe and economical way, it is vital to have a thorough knowledge of the underlying principles on which they rely.

This unit builds on the preliminary techniques and skills introduced in Unit 19: Electrical, Electronic and Unit 20: Digital Principles.

The emphasis in this unit will be in developing a structured approach to the analysis of AC single-phase and three-phase powered circuitry. This will help students to arrive at the solution in the most efficient way, with the greatest probability of it being correct. In addition, students will be introduced to the expanding use of computers, using specialised software to solve electrical, electronic and digital circuits. This will allow students to develop the necessary confidence and competence in the four key areas of mathematical techniques, circuit analysis, circuit simulation and laboratory practice.

Successful completion of this unit will enable students to cope with increasingly complex problems and prepare them for the challenge of Level 6 academic programmes.
Learning Outcomes

By the end of this unit students will be able to:

1. Use appropriate mathematical techniques to solve a range of electrical and electronic problems.

2. Apply appropriate circuit theorems to solve problems in electrical networks.

3. Use appropriate laboratory and computer simulation techniques to investigate both analogue and digital circuits and interpret the results.

4. Explain the characteristics of non-linear circuits to predict their behaviour under a variety of conditions.
Essential Content

**LO1  Use appropriate mathematical techniques to solve a range of electrical and electronic problems**

*Formal steady state circuit analysis:*
- Determinants, mesh analysis and nodal analysis (and their comparison)
- Analysis using ideal sources, superposition theorem

*AC circuit analysis:*
- Complex notation, polar and Cartesian coordinates, RLC circuits
- Advanced use of phasor diagrams
- Power: instantaneous power, power factor, apparent power, the power triangle

**LO2  Apply appropriate circuit theorems to solve problems in electrical networks**

*Three-phase theory:*
- Application of trigonometric methods to solution of phasor diagrams
- Application of complex numbers to represent quantities in AC circuits
- Single-phase representation
- Solution of balanced three-phase circuits
- Complex notation applied to three-phase, unbalanced loads, unconnected neutral point
- Power, reactive power and power factor correction for three-phase systems
LO3 Use appropriate laboratory and computer simulation techniques to investigate both analogue and digital circuits and interpret the results

*ECAD:*

Use of computer modelling and simulation techniques to analyse and solve electronic, electrical and digital circuits, such as filters and amplifiers using operational amplifiers and discrete devices; digital logic circuit elements; and simple combination and sequential circuits

LO4 Explain the characteristics of non-linear circuits to predict their behaviour under a variety of conditions

*Non-linear circuits:*

Characteristics of linear and non-linear circuits, mathematical modelling of a number of semiconductor devices, including diodes, bipolar and Field Effect Transistors and how this can be used to predict their ‘real’ behaviour in practice

Mathematically modelling the behaviour of semiconductor diodes, bipolar transistors and Field Effect Transistors
