

Unit 8: Mechanical Principles

Unit code	F/615/1482
Unit level	4
Credit value	15

Introduction

Mechanical principles have been crucial for engineers to convert the energy produced by burning oil and gas into systems to propel, steer and stop our automobiles, aircraft and ships, amongst thousands of other applications. The knowledge and application of these mechanical principles is still the essential underpinning science of all machines in use today or being developed into the latest technology.

The aim of this unit is to introduce students to the essential mechanical principles associated with engineering applications.

Topics included in this unit are: behavioural characteristics of static, dynamic and oscillating engineering systems including shear forces, bending moments, torsion, linear and angular acceleration, conservation of energy and vibrating systems; and the movement and transfer of energy by considering parameters of mechanical power transmission systems.

On successful completion of this unit students will be able to explain the underlying principles, requirements and limitations of mechanical systems

Learning Outcomes

By the end of this unit students will be able to:

1. Identify solutions to problems within static mechanical systems.
2. Illustrate the effects that constraints have on the performance of a dynamic mechanical system.
3. Investigate elements of simple mechanical power transmission systems.
4. Analyse natural and damped vibrations within translational and rotational mass-spring systems.

Essential Content

LO1 Identify solutions to problems within static mechanical systems

Shafts and beams:

The effect of shear forces on beams

Bending moments and stress due to bending in beams

Selection of appropriate beams and columns to satisfy given specifications

The theory of torsion in solid and hollow circular shafts

LO2 Illustrate the effects that constraints have on the performance of a dynamic mechanical system

Energy and work:

The principle of conservation of energy and work-energy transfer in systems

Linear and angular velocity and acceleration

Velocity and acceleration diagrams of planar mechanisms

Gyroscopic motion

LO3 Investigate elements of simple mechanical power transmission systems

Simple systems:

Parameters of simple and compounded geared systems

Efficiency of lead screws and screw jacks

Couplings and energy storage:

Universal couplings and conditions for constant-velocity

Importance of energy storage elements and their applications

LO4 Analyse natural and damped vibrations within translational and rotational mass-spring systems

Types of motion:

Simple harmonic motion

Natural frequency of vibration in mass-spring systems

Damped systems:

Frequency of damped vibrations in mass-spring-damper systems

The conditions for an external force to produce resonance

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
LO1 Identify solutions to problems within static mechanical systems		D1 Calculate the magnitude of shear force and bending moment in cantilever and encasté beams for a variety of applications
P1 Calculate the distribution of shear force, bending moment and stress due to bending in simply supported beams P2 Justify the selection of standard rolled steel sections for beams and columns P3 Determine the distribution of shear stress and the angular deflection due to torsion in solid and hollow circular shafts	M1 Determine the material of a circular bar from experimental data of angle of twist obtained from a torsion test	
LO2 Illustrate the effects that constraints have on the performance of a dynamic mechanical system		D2 Calculate solutions of velocities and accelerations within planar mechanisms using trigonometric methodology
P4 Explain the effects of energy transfer in mechanical systems with uniform acceleration present P5 Identify the magnitude and effect of gyroscopic reaction torque	M2 Construct diagrams of the vector solutions of velocities and accelerations within planar mechanisms	

Pass	Merit	Distinction
LO3 Investigate elements of simple mechanical power transmission systems		D3 Examine the cause of a documented case of mechanical power transmission failure and the steps taken to correct the problem and rectify any design faults
P6 Determine the velocity ratio for compound gear systems and the holding torque required to securely mount a gearbox P7 Calculate the operating efficiency of lead screws and screw jacks P8 Explain the conditions required for a constant velocity ratio between two joined shafts	M3 Examine devices which function to store mechanical energy in their operation	
LO4 Analyse natural and damped vibrations within translational and rotational mass-spring systems		
P9 Explain the natural frequency of vibration in a mass-spring system	M4 Determine the amplitude and phase angle of the transient response within a mass-spring damper system	D4 Identify the conditions needed for mechanical resonance and measures that are taken to prevent this from occurring
